INPROS Demo Script – Estimations Pilot

Presenter's guide · Prepared by Zenthic · November 2026 · about 20 minutes

The story in one line: **INPROS drawings in → quantities counted automatically → checked against the contract → the contractor's estimación validated in minutes, with every adjustment explained.** It answers the meeting's main ask: industry-specific help with drawings, quantity takeoffs, estimations and change detection, as a small, measurable pilot.

Before the client joins (10 minutes earlier)

#	Check	How
1	App running	Open **http://localhost:3100**. Top right must say **Backend connected** (green). If not, start it with the two commands at the end of this script.
2	Clean start	Use a new project name for the demo so the screens start empty (project names can repeat).
3	Files ready	Open two Explorer windows: **estimations\Data and Meeting Summary** (8 .dwg) and **estimations\data\samples** (catalog, 2 estimaciones, 3erNLUMI.dxf).
4	Screen	Browser full screen, zoom 100–110%. Close other tabs (port 3000 is another project).
5	Dry run	Do steps 1–6 once on a throw-away project the day before.

The demo, step by step

1. Open with the problem (~1 min)

Do	Stay on the home page.
You'll see	Steps 1–3 on the page, and the four next steps below them.
Say	“Today, checking an estimación means comparing progress against quantities and the contract catalog by hand. We built a pilot on your own drawings that does that comparison automatically.”

2. Upload the real drawings (~3 min)

Do	Create project *Oficinas Ejército Nacional – 3er nivel*, client *INPROS*. Drag all 8 .dwg files from **Data and Meeting Summary** into the box.
You'll see	Each file turns green in 1–3 seconds: 8 rows **Ready** with objects, symbols and labels (e.g. 3erNLUMI: 6,126 objects, 1,232 symbols).
Say	“These are the AutoCAD files you shared, read directly — no AutoCAD and no extra software. Every upload is versioned; uploading the same file twice is detected.”

3. Show one drawing (~2 min)

Do	Click **Open** → on **3erNLUMI**. Zoom into the plan with the mouse wheel. Show the **Symbols** tab, search *LAM*.
You'll see	The full lighting plan, and LAM-A ×322 on layer LUMINARIOS.
Say	“The system understands the drawing: layers, every symbol, every text label.”

4. Quantities (~2 min)

Do	Click the tab **4 Quantities**.
You'll see	Lighting plan: **Luminaire type A = 321 pza**. Excluded chips: *26 outside every sheet, 8 inside the legend box*. Conduit drawing has **sheet A and sheet B** separately.
Say	“322 symbols are in the file, but one is the sample in the legend, so the real count is 321. Objects parked outside the sheet and duplicate copies are removed too — and it shows you how many, so nothing disappears silently. This is exactly where manual takeoffs go wrong.”

5. Contract catalog (~3 min)

Do	Tab **5 Contract catalog** → **Upload catalog** → **samples\DEMO_catalogo_conceptos.xlsx**. Click **Confirm** on the suggestions. On **IE-020** click **Change** and pick *3erNTUBN-R · sheet A · Conduit run (TUBERIA) = 411.62 m*.
You'll see	12 catalog lines, 11 with a suggested drawing item. IE-001: contract 300 vs drawing 321 → **+21, +$38,850** (orange: drawing shows more).
Say	“The system proposes which drawing quantity measures each contract line; your engineer confirms it once per project. Now every line shows contract against drawing — here the drawings have 21 fixtures more than the contract. That's a change order to discuss before anyone bills it.”

6. Check the contractor's estimación (~4 min)

Do	Tab **6 Estimación check**. Number **1**, period *01–15 oct 2026*, file **DEMO_estimacion_01.xlsx** → **Upload and check**. Click **Only issues**. Then **Export validated Excel** and open it. Then **Approve approvable amounts**.
You'll see	Claimed **$528,950.00**, approvable **$475,700.00**, difference **$53,250.00**. Each flagged line says why: over contract, wrong unit price, code not in the contract, the same line twice, more than the drawings show.
Say	“In seconds: $53,250 that should not be paid as claimed, and the reason for each line. The corrected Excel is ready to send back. No copy-paste, no missed line.”

7. The next period (~2 min)

Do	Number **2**, file **DEMO_estimacion_02.xlsx** → **Upload and check**.
You'll see	IE-001: **120 already paid**, claim 200, contract 300 → only **180** approvable. IE-020: the contractor says 430 were paid before, the records say 400.
Say	“It remembers what was approved before, so cumulative over-billing is caught automatically.”

8. Revision changes (document control) (~2 min)

Do	Tab **1–3 Drawings** → upload **samples\3erNLUMI.dxf** (same name = new version). Open **3erNLUMI** → the **Revision changes** panel.
You'll see	Version 2 of 2. **+12 Luminaire type A (+$22,200)**, **–3 type C (–$4,950)**, **–42.03 m conduit**.
Say	“When a drawing is revised, you see what changed and what it costs at contract prices — no more comparing plans by eye.”

9. Close and the pilot ask (~1 min)

Do	Go back to the home page.
You'll see	—
Say	“To run this on a live project we need the catalog, two or three past estimaciones and the matching drawings — the list is in the information request. We propose a pilot on one project, measuring hours per estimación review before and after.”

Be clear about this when presenting

Topic	What to say
Catalog and estimaciones	The drawings are INPROS's own. The catalog, estimaciones and prices are **example data** built to show the check; real ones come from the information request.
Links	Suggestions are rule-based; an engineer confirms each one once per project. That is deliberate: payments must be defensible.
Accuracy limits	Tray length is an estimate (half of the two drawn edges). Conduit is measured per layer, not yet per diameter. Department breakdown needs zones drawn as areas (these drawings only have brackets).
Real drawings	Rules were tuned on these 8 drawings; new projects may need small rule adjustments in the pilot.
Technology	Runs in a browser. No AutoCAD or ODA licence needed; the DWG reader is open-source (MIT). No data is sent to outside AI services.

Likely questions

Question	Answer
Does it work with our current AutoCAD files?	Yes — DWG from AutoCAD 2000 to 2018 formats and DXF. Tested on the 8 files you sent.
What about Revit?	Not in the pilot. Revit models can export DWG/DXF sheets, which work today.
Can it connect to Odoo / Box?	Not yet. The pilot uses Excel in and out; integration comes after the pilot proves the value.
How long to set up a project?	Upload drawings and catalog, confirm links: under an hour for a catalog of this size.
What if the system is wrong?	Every number links back to the drawing item and rule that produced it, and links are confirmed by an engineer.

If the app is not running

Open two PowerShell windows:

Window	Command
1 – backend	cd "D:\My personel work\estimations\backend" uv run uvicorn app.main:app --port 8000
2 – frontend	cd "D:\My personel work\estimations\frontend" npm run dev

Then open http://localhost:3100. Do not use port 3000 — it belongs to another project on this laptop.
